

# Edilband

## Rubberised polyester tape

### Presentation

**Edilband** is a special rubberized polyester tape, coming in 50 m x 10 cm rolls.

### Applications

Use **Edilband** to waterproof joints between vertical and horizontal surfaces when using our **ElastiK System** (our exclusive system for refurbishing balconies and terraces without removing the old floor, or for waterproofing new balconies without having to create the usual 5 cm concrete screed on which tiles are laid).

On balconies and terraces, the joints between the floor and walls tend to crack, which can seriously affect their waterproof performance. By applying **Edilband** and using **ElastiK** to fix it and waterproof it, the waterproof performance of these delicate areas is guaranteed.

### Operating instructions

To apply **Edilband** to form a quarter round between the floor and the walls, use **ElastiK** as an adhesive and apply it only on the fabric edges of the tape, and not on the central rubber area. Twenty-four hours after applying the **Edilband** quarter round, waterproof the surface by applying two layers of **ElastiK**, completely covering both the fabric and the rubber.

### Warnings

**Edilband** can be preserved for a long time if kept in its original package and out of direct sunlight.
